

THE TRIASSIC PERIOD IN EAST DEVON

LIFE & LANDFORMS WORDSEARCH

To see this lost world you would have to travel back 235 million years to the Triassic period. Then, deserts smothered a super-continent called Pangea and in the dry heat sand dunes swept across the plains. The Jurassic Coast part of the desert was shaped by water brought in by rivers and stream. It was the time the earliest ancestors of dinosaurs emerged. On the river banks other creatures like rhynchosours, giant ambibians and insects thrived amongst the conifers, cycads and horsetail plants.
